

method for assessing protein folding and/or solubility comprising:

10

b) expressing said fusion protein in a host cell that also expresses a second segment of said marker protein, wherein said second segment is capable of structural complementation with said first segment; and

providing an expression construct comprising (i) a gene encoding fusion protein.

said fusion protein comprising a protein of interest fused to a first segment of a

marker protein, wherein said first segment does not affect the folding or solubility

of the protein of interest, and (ii) a promoter active in said host cell and operably

c)

determining structural complementation,

linked to said gene;

15 20

wherein a greater degree of structural complementation, as compared to structural complementation observed with appropriate negative controls, indicates proper folding and/or solubility of said protein.

- 2. The method of claim 1, wherein said fusion is C-terminal to said protein of interest.
- 3. The method of claim 1, wherein said fusion is N-terminal to said protein of interest.
- 4. The method of claim 1, wherein said marker protein is selected from the group consisting of a target binding protein, an enzyme, a protein inhibitor, a fluorophore and a chromophore.
 - The method of claim 4, wherein said marker protein is a target binding protein. 5.
 - 6. The method of claim 5, wherein said target binding protein is ubiquitin.
 - 7. The method of claim 4, wherein said marker protein is a chromophore.

- 8. The method of claim 7, wherein said chromophore is green fluorescent protein, blue fluorescent protein, yellow fluorescent protein, luciferase or aquorin.
- 5 9. The method of claim 4, wherein said marker protein is an enzyme.
 - 10. The method of claim 9, wherein said enzyme is β-galactosidase, cytochrome c, chymotrypsin inhibitor, Rnase, phosphoglycerate kinase, invertase, staphylococcal nuclease, thioredoxin C, lactose permease, amino acyl tRNA synthase, and dihydrofolate reductase.
 - 11. The method of claim 10, wherein said enzyme is β -galactosidase.
 - 12. The method of claim 11, wherein said first segment is the α -peptide of β -galactosidase, and said second segment is the ω -peptide of β -galactosidase.
 - 13. The method of claim 1, wherein said protein of interest is Alzheimer's amyloid peptide (Aβ), SOD1, presenillin 1 and 2, α-synuclein, amyloid A, amyloid P, CFTR, transthyretin, amylin, lysozyme, gelsolin, p53, rhodopsin, insulin, insulin receptor, fibrillin, α-ketoacid dehydrogenase, collagen, keratin, PRNP, immunoglobulin light chain, atrial natriuretic peptide, seminal vesicle exocrine protein, β2-microglobulin, PrP, precalcitonin, ataxin 1, ataxin 2, ataxin 3, ataxin 6, ataxin 7, huntingtin, androgen receptor, CREB-binding protein, dentaorubral pallidoluysian atrophy-associated protein, maltose-binding protein, ABC transporter, glutathione S transferase, and thioredoxin.
 - 14. The method of claim 1, wherein a gene encoding said second segment is carried on a chromosome of said host cell.
- 15. The method of claim 1, wherein a gene encoding said second segment is carried episomally in said host cell.

25

- 16. The method of claim 1, wherein said host cell is selected from the group consisting of a bacterial cell, an insect cell, a yeast cell, a nematode cell, and a mammalian cell.
- 17. The method of claim 16, wherein said host cell is a bacterial cell.

5

- 18. The method of claim 17, wherein said bacterial cell is *E. coli*.
- 19. The method of claim 18, wherein said promoter is the *Tag* promoter; T7 promoter, or the P_{lac} promoter.

10

20

20. The method of claim 16, wherein said host cell is a nematode cell.

21. The method of claim 20, wherein said nematode cell is a *C. elegans* cell.

22. The method of claim 16, wherein said host cell is an insect cell.

23. The method of claim 22, wherein said host cell is a S. fugeria cell.

24. The method of claim 16, wherein said host cell is a yeast cell.

25. The method of claim 14, wherein said promoter is CupADH or Gal.

- 26. The method of claim 16, wherein said host cell is a mammalian cell.
- The method of claim 26, wherein said promoter is PepCk or tk. 25 27.
 - 28. The method of claim 1, wherein said negative control utilizes a host cell lacking the second segment of said marker protein.
- 30 29. The method of claim 1, wherein said negative control utilizes a fusion protein that is improperly folded and/or insoluble.

- a) providing a gene encoding fusion protein comprising (i) a protein of interest and (ii) a first segment of a marker protein, wherein said first segment does not affect the folding or solubility of the protein of interest, , wherein said fusion protein is not properly folded and/or soluble when expressed in said host cell;
- b) mutagenizing that portion of the gene encoding said protein of interest;
- c) expressing said fusion protein in a host cell that expresses a second segment of said marker protein, wherein said second segment is capable of structural complementation with said first segment; and
- d) determining structural complementation,

wherein a relative increase in structural complementation, as compared to the structural complementation observed with the unmutagenized fusion protein, indicates an increase in proper folding and/or solubility of said protein.

- 31. The method of claim 30, wherein said fusion is C-terminal to said protein of interest.
- The method of claim 30, wherein said fusion is N-terminal to said protein of interest.
- 33. The method of claim 30, wherein said marker protein is selected from the group consisting of a target binding protein, an enzyme, a protein inhibitor, a chromophore.
- 25 34. The method of claim 30, wherein said host cell is selected from the group consisting of a bacterial cell, an insect cell, a yeast cell, a nematode cell, a mammalian cell.
 - 35. A method for screening candidate modulator substance that modulates protein folding and/or solubility comprising:

5

10

15

20<u>.</u>

5

10

14 20

- a) providing an expression construct comprising (i) a gene encoding fusion protein, said fusion protein comprising a protein of interest fused to a first segment of a marker protein, wherein said first segment does not affect the folding or solubility of the protein of interest, and (ii) a promoter active in said host cell and operably linked to said gene;
- b) expressing said fusion protein in a host cell that expresses a second segment of said marker protein, wherein said second segment is capable of structural complementation with said first segment;
- c) contacting the host cell with said candidate modulator substance; and
- d) determining structural complementation,

wherein a relative change in structural complementation, as compared to the structural complementation observed in the absence of said candidate modulator substance, indicates that said candidate modulator substance is a modulator of protein folding and/or solubility.

- 36. The method of claim 35, wherein said fusion is C-terminal to said protein of interest.
- 37. The method of claim 35, wherein said fusion is N-terminal to said protein of interest.
- 38. The method of claim 35, wherein said marker protein is selected from the group consisting of a target binding protein, an enzyme, a protein inhibitor, a chromophore.
- The method of claim 35, wherein said host cell is selected from the group consisting of a bacterial cell, an insect cell, a yeast cell, a nematode cell, a mammalian cell.
 - 40. The method of claim 35, wherein said candidate modulator substance is selected from the group consisting of a protein, a nucleic acid or a small molecule.
